### Cruise Report 834<sup>th</sup> cruise FFS Solea, 08/05 to 16/05/2024

#### EEZ Survey North Sea – Natura2000 area Sylt Outer Reef and Amrumbank

Cruise leader: Dr. Holger Haslob

##### 1. Summary

This cruise was part of the DAM pilot mission MGF North Sea 2. The objective of this project is to evaluate the potential effects on fish and epibenthic communities in the Natura2000 areas (German EEZ, North Sea) following the exclusion of bottom trawling since May 2023. Originally, this cruise aimed to implement and further test the monitoring concept for fish and epibenthic communities developed exactly for this task during the first phase of the DAM pilot mission. This concept includes the use of traditional monitoring methods, such as 3-meter and 2-meter beam trawls, to compare the results with baseline data on fish and epibenthos obtained during the first project phase and from monitorings by the Thünen Institute of Sea Fisheries since 2002 in those areas. However, due to uncertainties regarding exemptions for scientific trawl deployments, the Thünen Institute of Sea Fisheries, after consultations with the BfN, decided not to deploy beam trawls in the strictly protected areas. Consequently, the cruise program was adjusted, and only stations outside protected areas were sampled using bottom trawls. This adjustment was somewhat counterproductive to the project's goals, as it prevented direct comparison of trawl results from protected areas with those from areas where bottom-contact fishing gear is still permitted. Besides the use of beam trawls also BRUVs were deployed on selected stations (in cooperation with the University of Oldenburg), and water samples were taken for eDNA analysis. This will allow further comparisons of the classical monitoring methods with newly developed non-invasive methods.

## **2. Goal of the cruise**

This cruise was part of the DAM pilot mission MGF North Sea 2. The objective of this project is to evaluate the potential effects on fish and epibenthic communities in the Natura2000 areas (German EEZ, North Sea) following the exclusion of bottom trawling since May 2023. Originally, this cruise aimed to implement and further test the monitoring concept for fish and epibenthic communities developed during the first phase of the DAM pilot mission. This concept includes the use of traditional monitoring methods, such as 3-meter and 2-meter beam trawls, to compare the results with (i) baseline data on fish and epibenthos obtained during the first project phase and from monitoring by the Thünen Institute of Sea Fisheries since 2002 in those areas, and (ii) to compare results from protected areas with results from areas where bottom trawling continues. However, due to uncertainties regarding exemptions for scientific trawl deployment, the Thünen Institute of Sea Fisheries, after consultations with the BfN, decided not to deploy beam trawls in the protected areas. Consequently, the cruise program was adjusted, and only stations outside protected areas were sampled using bottom trawls. This adjustment was somewhat counterproductive to the project's goals, as it prevented direct comparison of trawl results from protected areas with those from areas where bottom-contact fishing gear is still permitted. Stations outside the protected areas were fished with 3-meter and 7-meter beam trawl in parallel, to further compare the catchability of both gears. Additionally, important biological data of fish and epibenthic invertebrates were sampled (e.g., length and weight measurements of epibenthic invertebrates, biomass and abundance of fish and epibenthos, age structure of dab and plaice population).

Besides the use of beam trawls also BRUVs were deployed on selected stations (in cooperation with the University of Oldenburg), and water samples were taken for eDNA analysis. This will allow further comparisons of the classical monitoring methods with newly developed non-invasive methods.

## **3. Cruise schedule**

The cruise started as scheduled on the 8<sup>th</sup> of May 8, 2024, from Cuxhaven, with station work beginning in the morning of the 9<sup>th</sup> May. The BRUVs and the 7-meter and 3-meter beam trawls were first deployed at the westernmost stations in the Sylt Outer Reef area (Stations 18, 20, 9, 11; Fig. 1). Favorable weather conditions allowed station work to continue in the Sylt Outer Reef and Eastern German Bight, using BRUVs, water samplers, CTD, and beam trawls until the 12<sup>th</sup> May (Stations 27, 33, 34; 32, 35, 42; 6, 14, 22, 25). On the 13<sup>th</sup> May, two remaining stations in the Eastern German Bight (50, 48) were fished using the 3-meter and 7-meter beam trawls. Later that day, the 3-meter beam trawl was deployed in the Amrumbank area, completing all planned six hauls there that same day. The following day, one remaining station in the Sylt Outer Reef area was fished with the 7-meter and 3-meter beam trawls (49). Then, the Amrumbank stations were fished with the 2-meter beam trawl that same day, achieving seven hauls, one of which was invalid. With the final 2-meter beam trawl station on the Amrumbank, all planned trawl stations for the modified cruise program were completed.

On May 15<sup>th</sup>, morning weather conditions permitted an additional BRUV deployment at the Amrumbank station AB05. Station work concluded when the BRUVs were recovered approximately two hours later. Due to increasing winds and an unfavourable weather forecast, no further BRUV stations were conducted, and the cruise ended on May 16<sup>th</sup> in Cuxhaven.

## **4. Preliminary results**

### **Haul composition**

The haul composition of the 7-meter and 3-meter beam trawl was primarily dominated by dab (*Limanda limanda*) and plaice (*Pleuronectes platessa*) among the fish species. Other abundant fish species included dragonet (*Callionymus lyra*), solenette (*Buglossidium luteum*), and scaldfish (*Arnoglossum laterna*). In terms of epibenthic invertebrates, *Asterias rubens*, *Ophiura ophiura*, *Astropecten irregularis*, and *Pagurus bernhardus* were the dominant species. However,

species composition varied across different habitats, particularly for epibenthic invertebrates (Fig. 4 and Fig. 5). For instance, the westernmost stations (<40m bottom depth) were dominated by *Echinocardium cordatum*, which inhabits the muddy habitat found at that location.

### eDNA sampling and BRUV deployments

At 20 stations in the Sylt Outer Reef, water samples were collected alongside the 3-meter and 7-meter beam trawls and the BRUV deployments. Sylphium eDNA dual filter capsules were used for eDNA sampling. The goal was to push 2 liters of sampled seawater directly through the filter using a syringe (200 ml). While this method worked well at some stations, it was not possible to reach the 2-liter volume at others due to clogging. Therefore, for future deployments, pre-filtering is recommended to remove larger particles, such as phytoplankton, fish eggs, and gelatinous particles. The samples will be sequenced and further processed in the coming months, and no eDNA results are available yet.

BRUVs were deployed at eight stations, with three BRUVs at each station. The quality of the BRUV footage varied largely, with one station having zero visibility. Preliminary screening of the BRUV videos revealed mostly flatfish, either dab or plaice, although species-level identification was not possible during this initial analysis and will certainly be challenging in subsequent analyses. Other recorded fish species included whiting, grey gurnard, and one haddock. Epibenthic invertebrates observed were *Asterias rubens*, swimming crabs, and hermit crabs. At one western station (<40m, mud), a Norway lobster (*Nephrops norvegicus*) was recorded, a species not detected by beam trawling.

### 6. Participants

Lisanne Hoch	TI-SF	whole cruise
Felix Bügler	TI-SF	whole cruise
Katja Fiegener	University of Oldenburg	whole cruise
Michael Weinert	TI-SF	whole cruise
Dr. Hermann Neumann	TI-SF	whole cruise
Dr. Holger Haslob (CL)	TI-SF	whole cruise

### 7. Acknowledgements

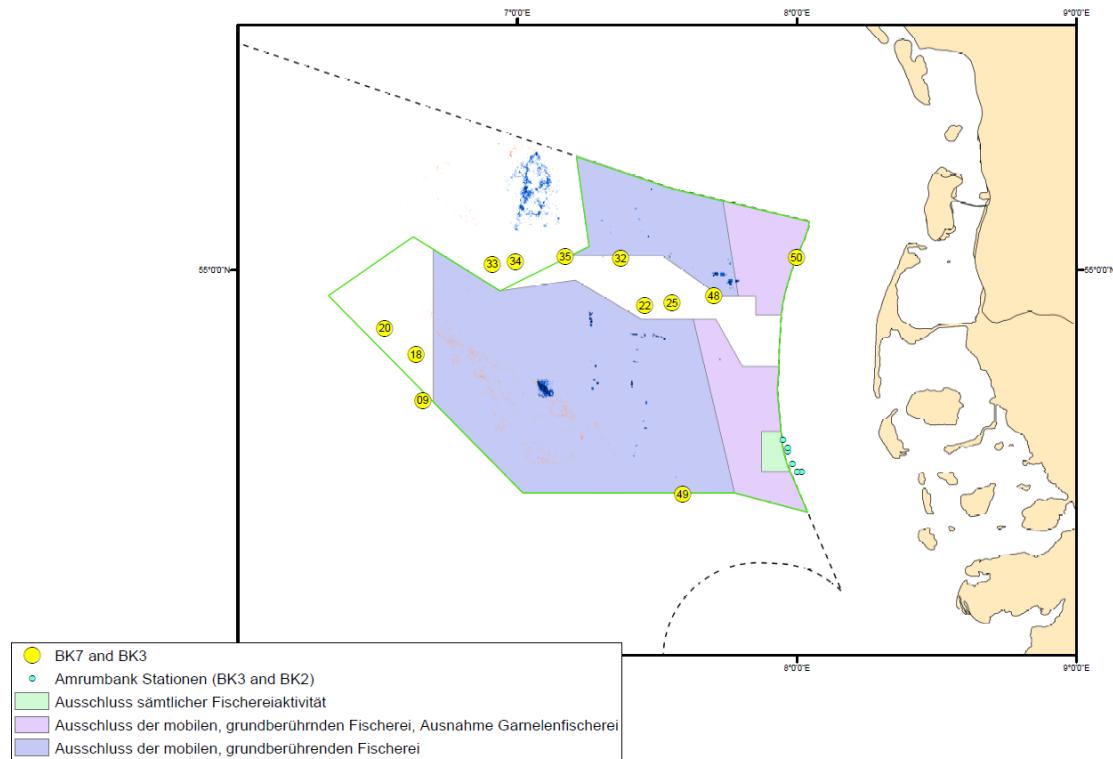

Thanks to Captain Koops and the crew of FFS Solea for their excellent support during the cruise.

Thanks to all cruise participants for their support and willingness to realize the sampling program.

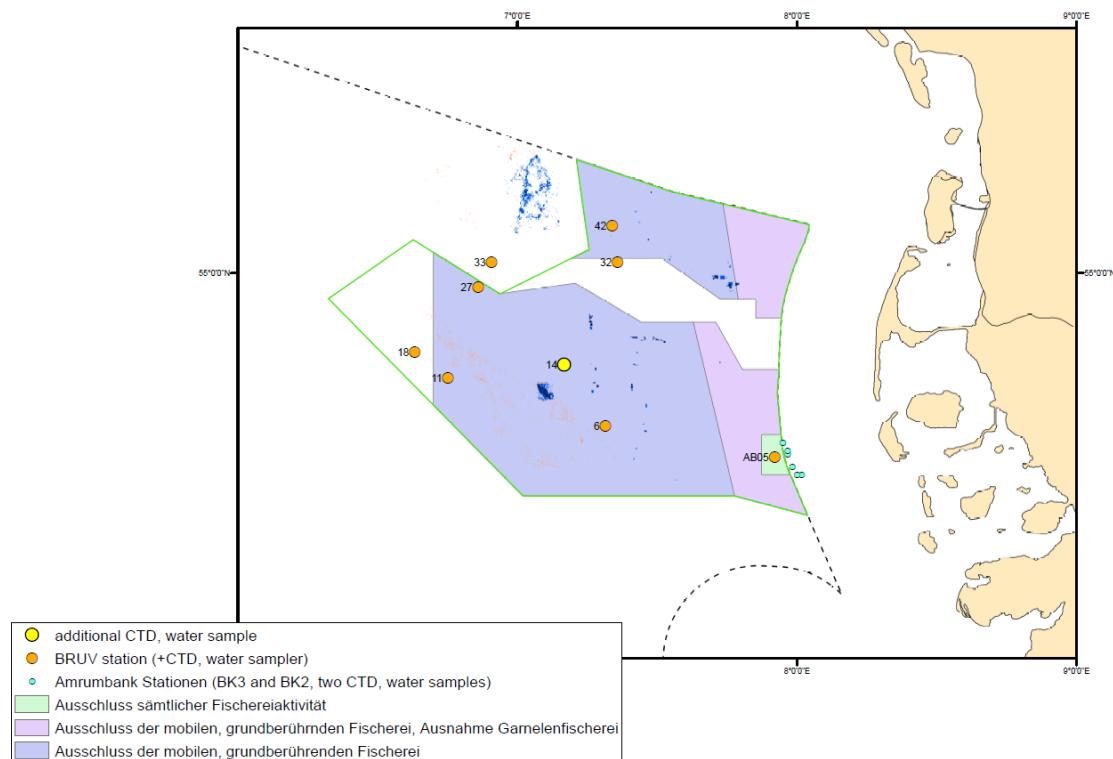

Dr. Holger Haslob
